AI4EIC (September 8, 2021)

## CLAS12 (Hall-B)

- Drift Chamber inside Toroidal field for forward tracks.
  - Electromagnetic Calorimeter for electron identification and neutral particle detector.
  - Time of Flight system for particle identification.
  - High Threshold Cherenkov Detector for electron pion rejection.
  - Silicon tracker for central detector charged particle tracking in Solenoidal Field.
  - Central Neutron Detector for neutron identification.
- 
- DAQ data rate 12 kHz,
  - Data rate 400 Mb/sec
  - Up-to-Date collected ~1.2 Pb

## Charged Particle Tracking

- ▶ Charged particles are tracked using Drift Chambers inside toroidal magnetic field.
  - ▶ Each sector consists of 3 regions
  - ▶ Each region consists of two cambers (Super-Layer)
  - ▶ Super-Layer has 6 layers
  - ▶ Each Layer has 112 wires
- ▶ Each sector is matrix of 36x112 wires that charged particles passes
- ▶ Each super layer hits are clustered together
- ▶ Track candidate is format from 6 clusters (one from each super layer)

Sector 1

Six sectors shown

## Classification

- ▶ Each event contains many combinations of clusters that can form a track.
- ▶ Teaching AI which combinations are good and which are bad will help the network to discern from given combinatorics which candidate has higher probability to be a good track.
- ▶ Possibly will speed up tracking code (**80%-90% of total data processing time**) by considering only AI suggested track candidates.

## Fixing Inefficiencies

- ▶ Some regions of inefficiency in drift chambers can result in missing clusters in one of the super layers.
- ▶ Track classifier can recognize good tracks composed of 6 clusters.
- ▶ We need some methods to predict where missing cluster position will be.
- ▶ Then classifier can identify good track candidate.

- ▶ Events with 2 tracks in one sector are chosen for training sample generation.
- ▶ 4 training track candidates are constructed:
  - ▶ 2 “**TRUE**” tracks that were reconstructed by tracking algorithm
  - ▶ 2 “**FALSE**” tracks by swapping 1 or 2 (decided by random number generator) clusters from adjacent track.

TRUE TRACK

FALSE TRACK

TRUE TRACK

FALSE TRACK

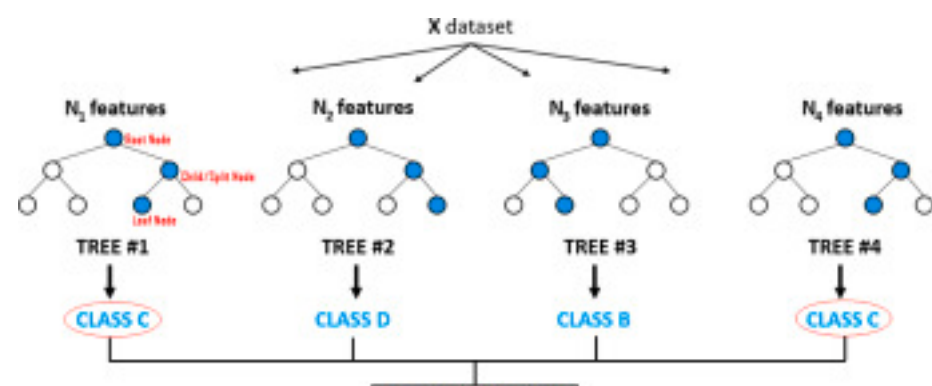

Convolutional Neural Network (**CNN**)

Multi-Layer Perceptron (**MLP**)

Extremely Randomized Trees (**ERT**)

Recurrent Neural Network (**RNN**)

- Different Network types were evaluated for accuracy and speed.
- MLP is chosen to be the best fit, due to implementation simplicity, accuracy and inference speed.

	Features	TP	FP	PA	TA	Time (ms)
<b>ERT</b>	6	100%	6.14%	100%	100%	0.36
<b>MLP</b>	6	99.96%	10.77%	98.88%	99.65%	0.12
<b>CNN</b>	36x112	96.11%	28.11%	94.26%	94.26%	1.2
<b>RNN</b>	36	88.40%	11.60%	-	-	-

TP - True Positive  
FP - False Positive  
TA - Training Accuracy  
PA - Positive Accuracy : percentage of tracks where False Positive in an event has lower probability than True Positive

- ▶ Auto-encoder is a type of neural network that can be used to learn a compressed representation of raw data.
- ▶ An auto-encoder is composed of an encoder and a decoder sub-models. The encoder compresses the input and the decoder attempts to recreate the input from the compressed version provided by the encoder.
- ▶ **Typically used for de-noising, but can be used for fixing glitches (our case).**

Training Sample for Auto-Encoder

- ▶ Use Auto-Encoders to fix the missing cluster (provide a position)
- ▶ Good reconstructed tracks are used to generate training samples by removing one cluster from each super layer

- Uncertainty in prediction for cluster position for good tracks is 0.36 wire out of 112

- Uncertainty in prediction for cluster position vs Super-layer with missing cluster

25 candidates

- ▶ Construct all combinations of 6 cluster tracks from hits (25 candidates in the example)
- ▶ Evaluate track candidate likelihood using classifier neural network
- ▶ **Remove hits belonging to the track from list of hits.**
- ▶ Add track candidate to the list of possible tracks (with it's probability provided by classifier)

29 candidates

- ▶ Construct combinations of 5 cluster track candidates (29 combinations in the example)
- ▶ Generate **pseudo-hits** in missing super-layers using Auto-Encoder neural network
- ▶ Turn them into 6 super-layer track candidates

- ▶ Evaluate 6 clusters track candidates (with **pseudo-hit**) using classifier neural network
- ▶ Add track candidate to the list of possible tracks with appropriate probability

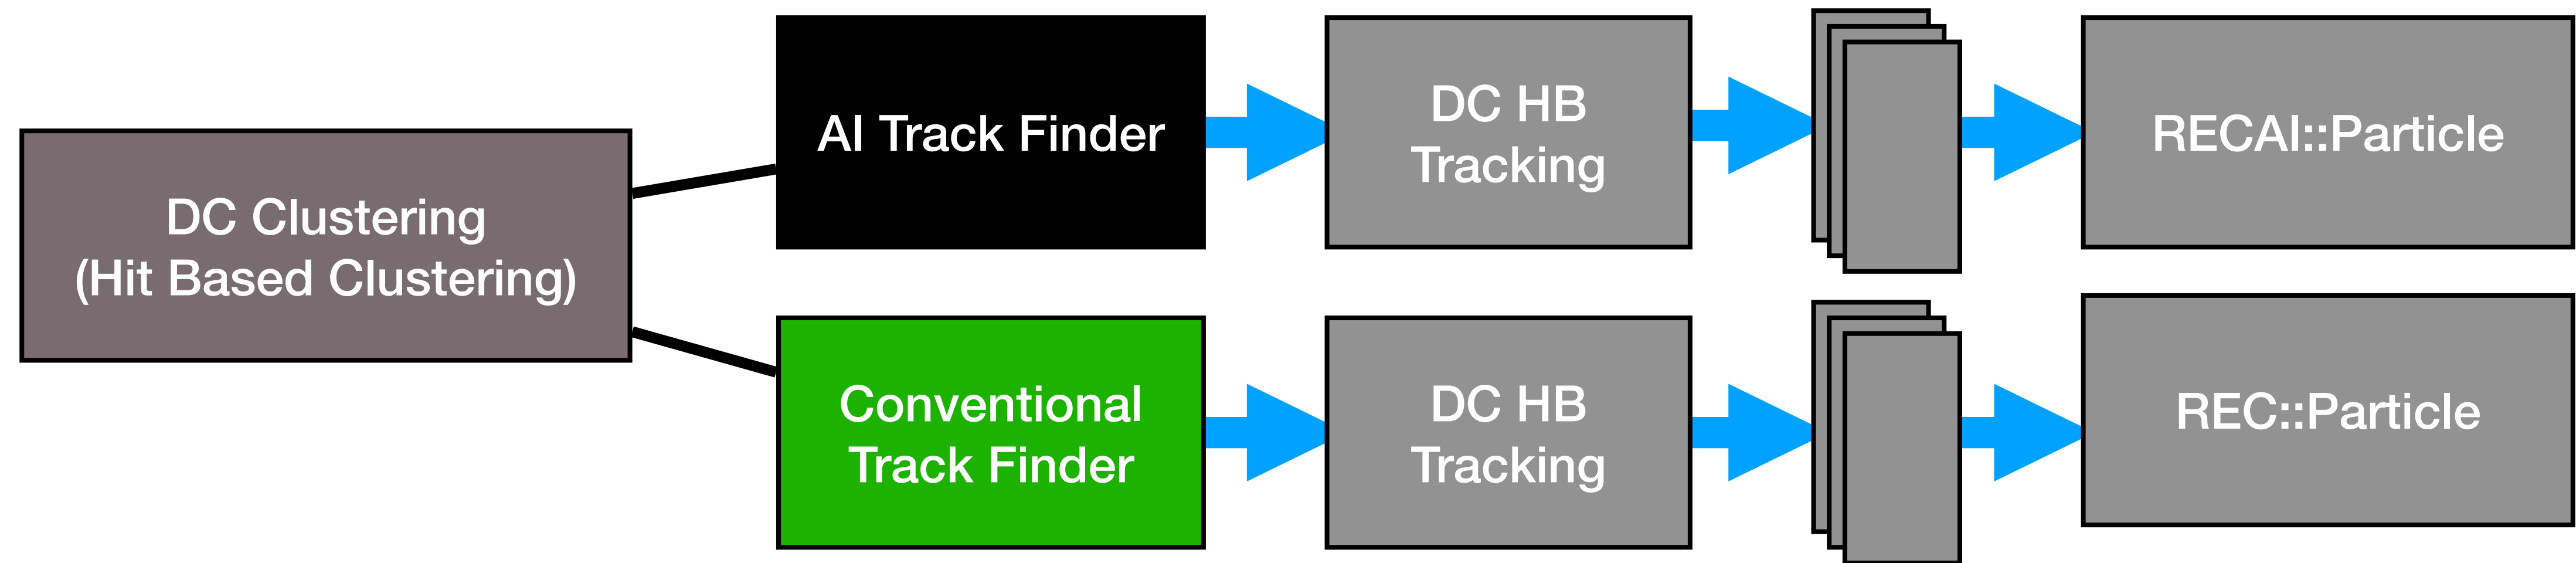

- ▶ Relative fraction of 5 super-layer tracks is about ~10% of total positively charge particles.
- ▶ The gain in number of 5 super-layer tracks is about x2.2 (**120% increase**)
- ▶ The gain in 6 super-layer track reconstruction with AI suggested track candidates is ~6%.
- ▶ Due to high gain in 5 super-layer track (where combinatorics is much larger for given number of segments) the total increase in tracks reconstructed is **~15.6%**

Positive Charge	Conventional	Artificial Intelligence	Gain
6 CLUSTER	242,145	256,175	1.0579
5 CLUSTER	24,155	52,839	<b>2.1875</b>
TOTAL	267,339	309,058	<b>1.1561</b>

- ▶ Questions:
  - ▶ Are these real tracks ?
  - ▶ How does this translate into physics ?
  - ▶ Is this gain real ?

- ▶ AI track classification and segment recovery network was implemented as a CLARA service.
- ▶ Tracking code was modified to separate clustering from track finding

- ▶ Data analyzed in two parallel service compositions with separate output for Time Based Tracking
- ▶ The parallel branches produce separate particle banks
- ▶ Tracking code in the AI branch is **35%** faster compared to conventional branch
- ▶ The full chain will be available soon for users to analyze and compare results from AI assisted tracking with conventional tracking.

- Implementation of AI assistance in CLAS12 tracking lead to tracking speed improvement of **~35%**.
- Particle reconstruction efficiency increased when using only AI suggested tracks.
- Study was performed to measure tracking efficiency as a function of experiment luminosity (beam current)
- Conventional tracking efficiency decreases by **0.40%** per nA of beam current.
- AI assisted tracking efficiency drops by **0.22%** per nA.
- Efficiency drop improved by factor of **~2x**.

$$ep \rightarrow e' \pi^+ (X)$$

$$ep \rightarrow e' \pi^+ \pi^- (X)$$

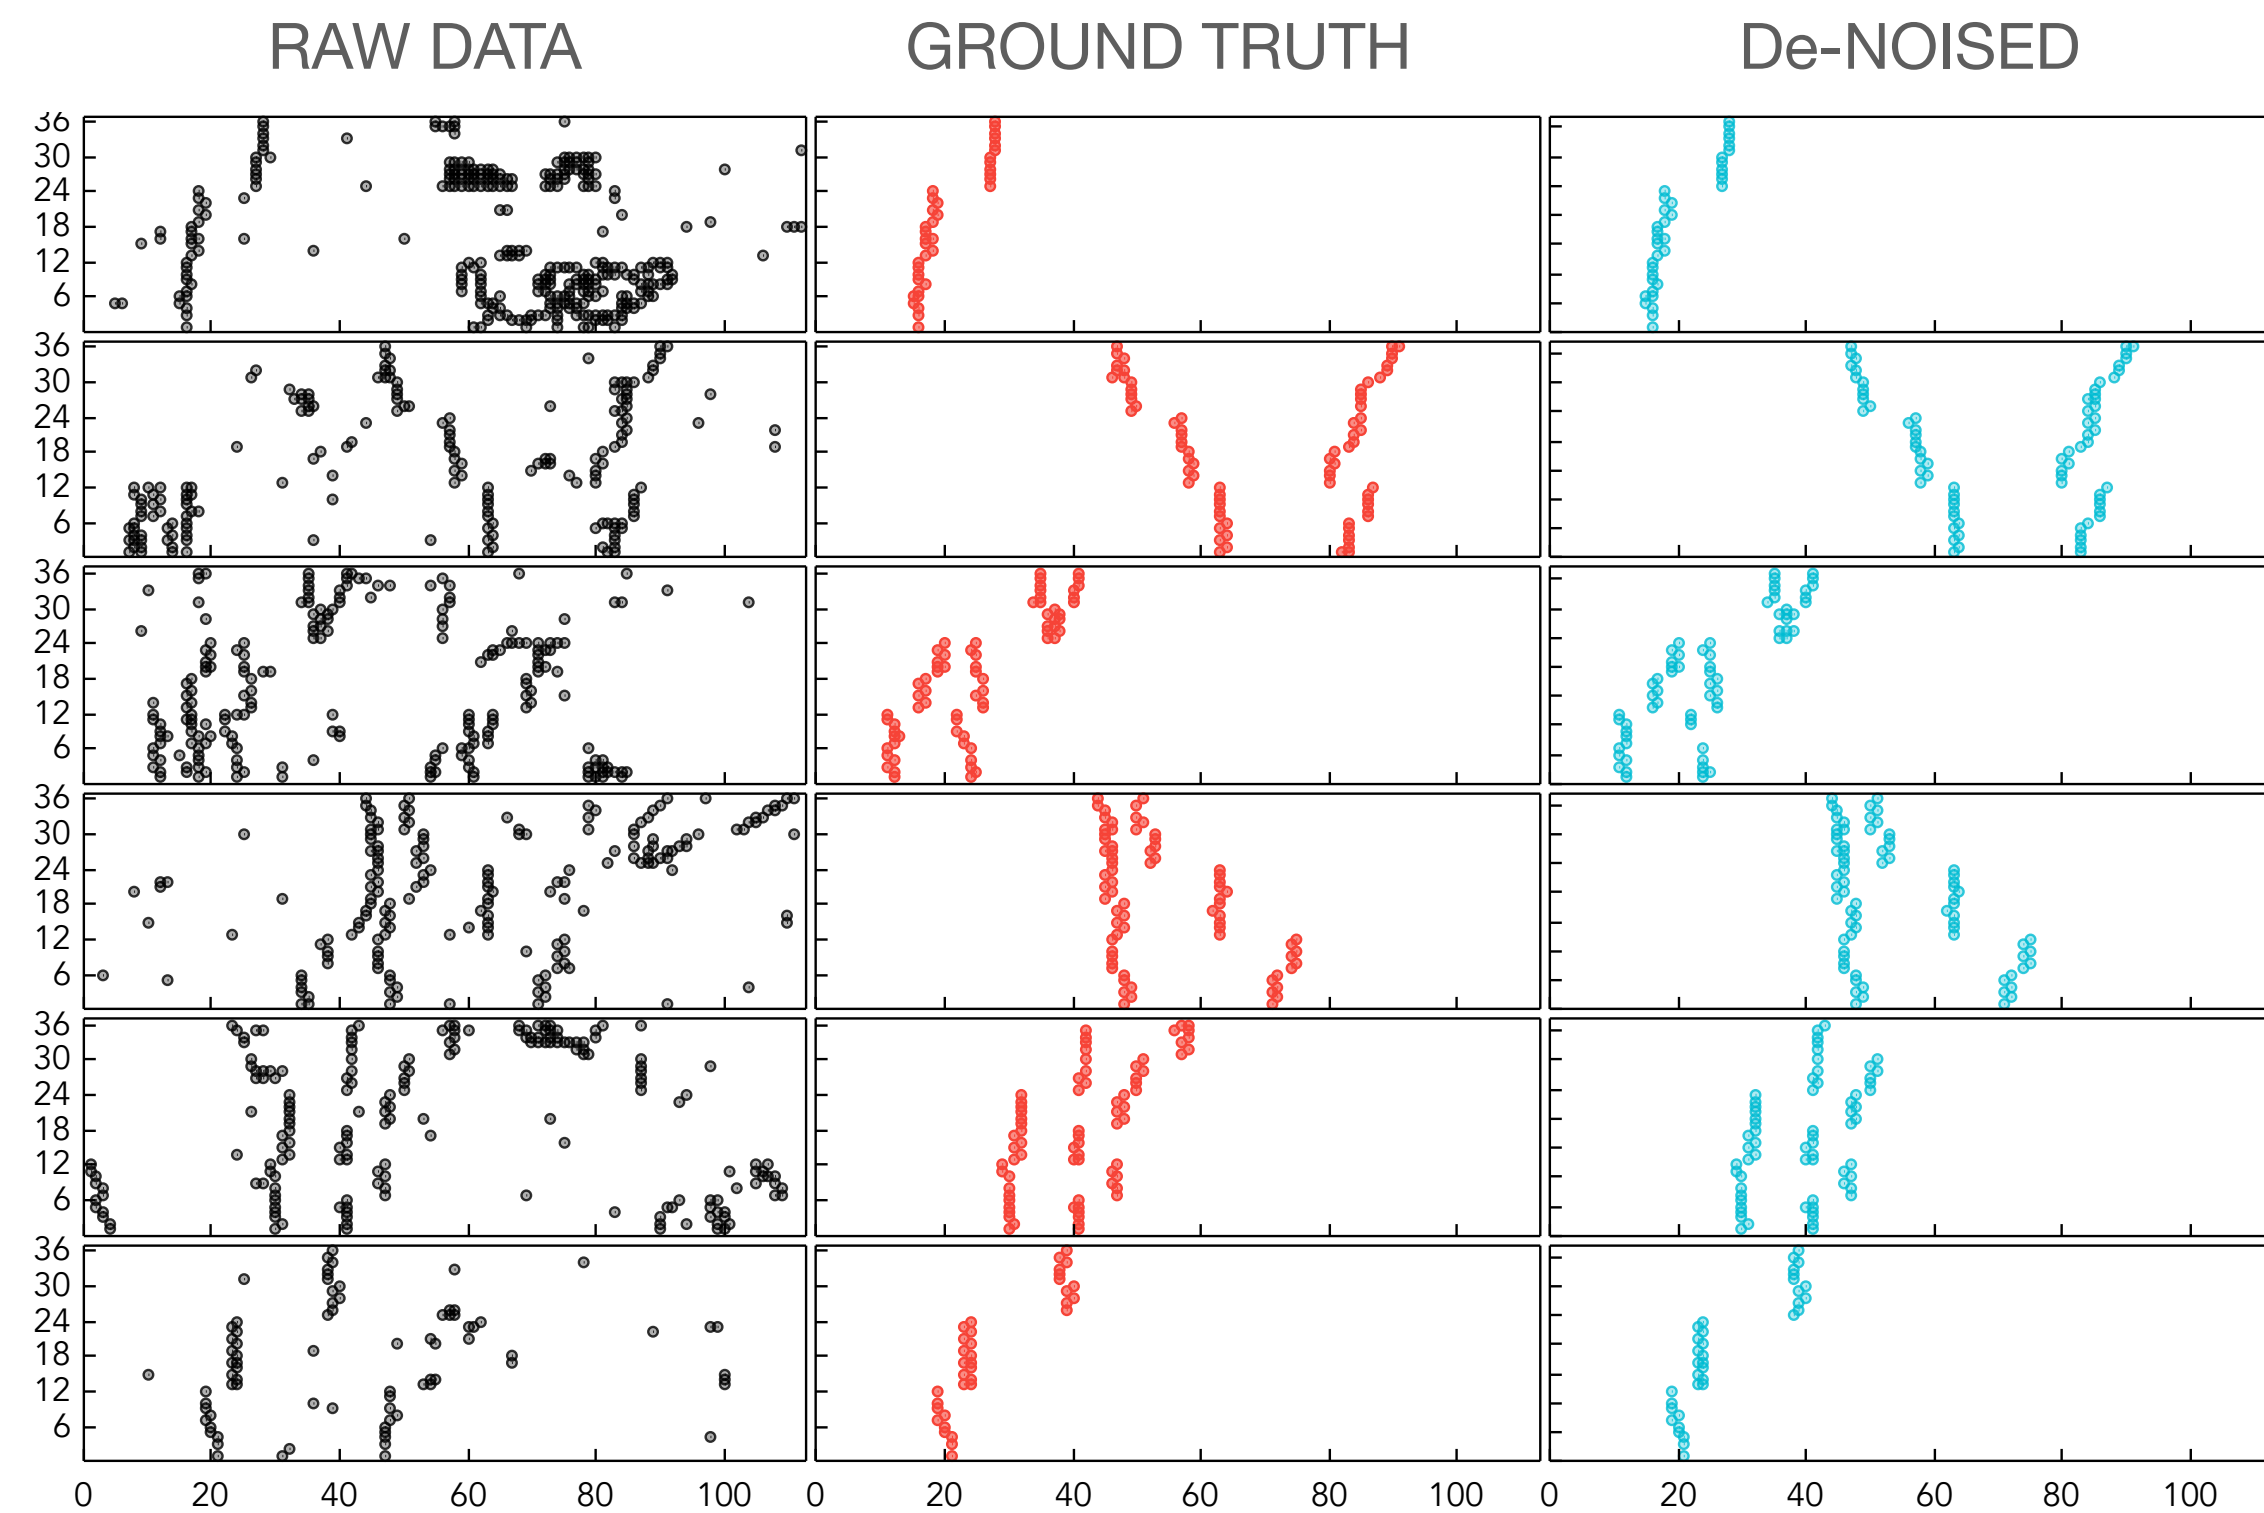

- CLAS12 tracking code reconstruction efficiency improved with introduction of AI into track candidate finding.
- The tracking code speed improved by **~35%**
- **What is the physics impact ?**
- Two particle final state ( $ep \rightarrow e' \pi^+ X$ ) missing mass shows **~20%** more event under proton peak. The gain is constant over the whole range of missing mass.
- Three particle final state ( $ep \rightarrow e' \pi^+ \pi^- X$ ) missing mass shows **~35%** increase in statistics of missing proton.

- ▶ Using Convolutional Auto-Encoders we can clean raw data sample to leave only hits that belong to a track.
- ▶ Network is trained on “good” reconstructed tracks from experimental data.

NOISY

CORRECT

De-NOISED

- Generated 250 tracks with background, trained on noisy image and ground truth
- Over 90% of original hits are reconstructed on the de-noised image
- Less than 5% of noise remains on the de-noised image
- Validation curve matching with training accuracy ensures no over-fitting

NOISY

CORRECT

De-NOISED

- ▶ Similar De-noising techniques can be used for EIC tracker to clean background hits
- ▶ With many interactions classification from combinatorics can help identify good tracks.
- ▶ Predicting missing hits (inefficiencies can also benefit tracking efficiency)

## EIC Tracker

## ► AI assisted tracking:

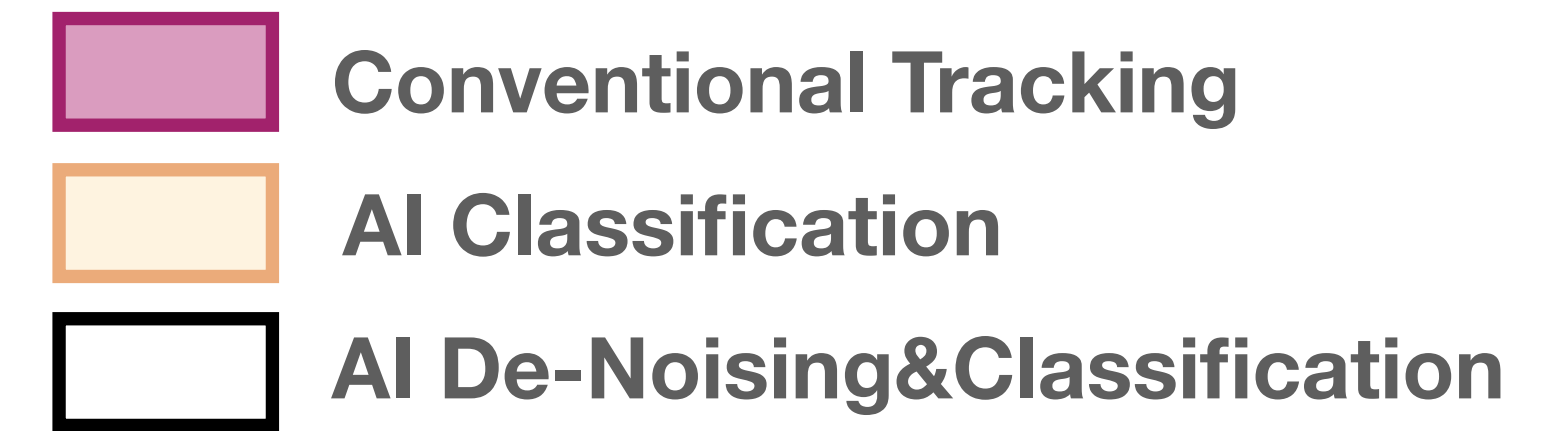

- Two types of Neural Networks are developed to assist tracking code:
  - Track candidate classifiers
  - Inefficiency recovery network based on Auto-Encoders
- The implementation in standard reconstruction code lead to improvements:
  - Tracking code speedup of **~35%**.
  - Particle track reconstruction efficiency improvement of **~15%** for standard running conditions (40-50nA).

## ► Physics Impact

- Improved efficiency for physics outcome for multi particle final states
  - Improvement in statistics **20%-35%** (for standard running conditions)

## ► Future work

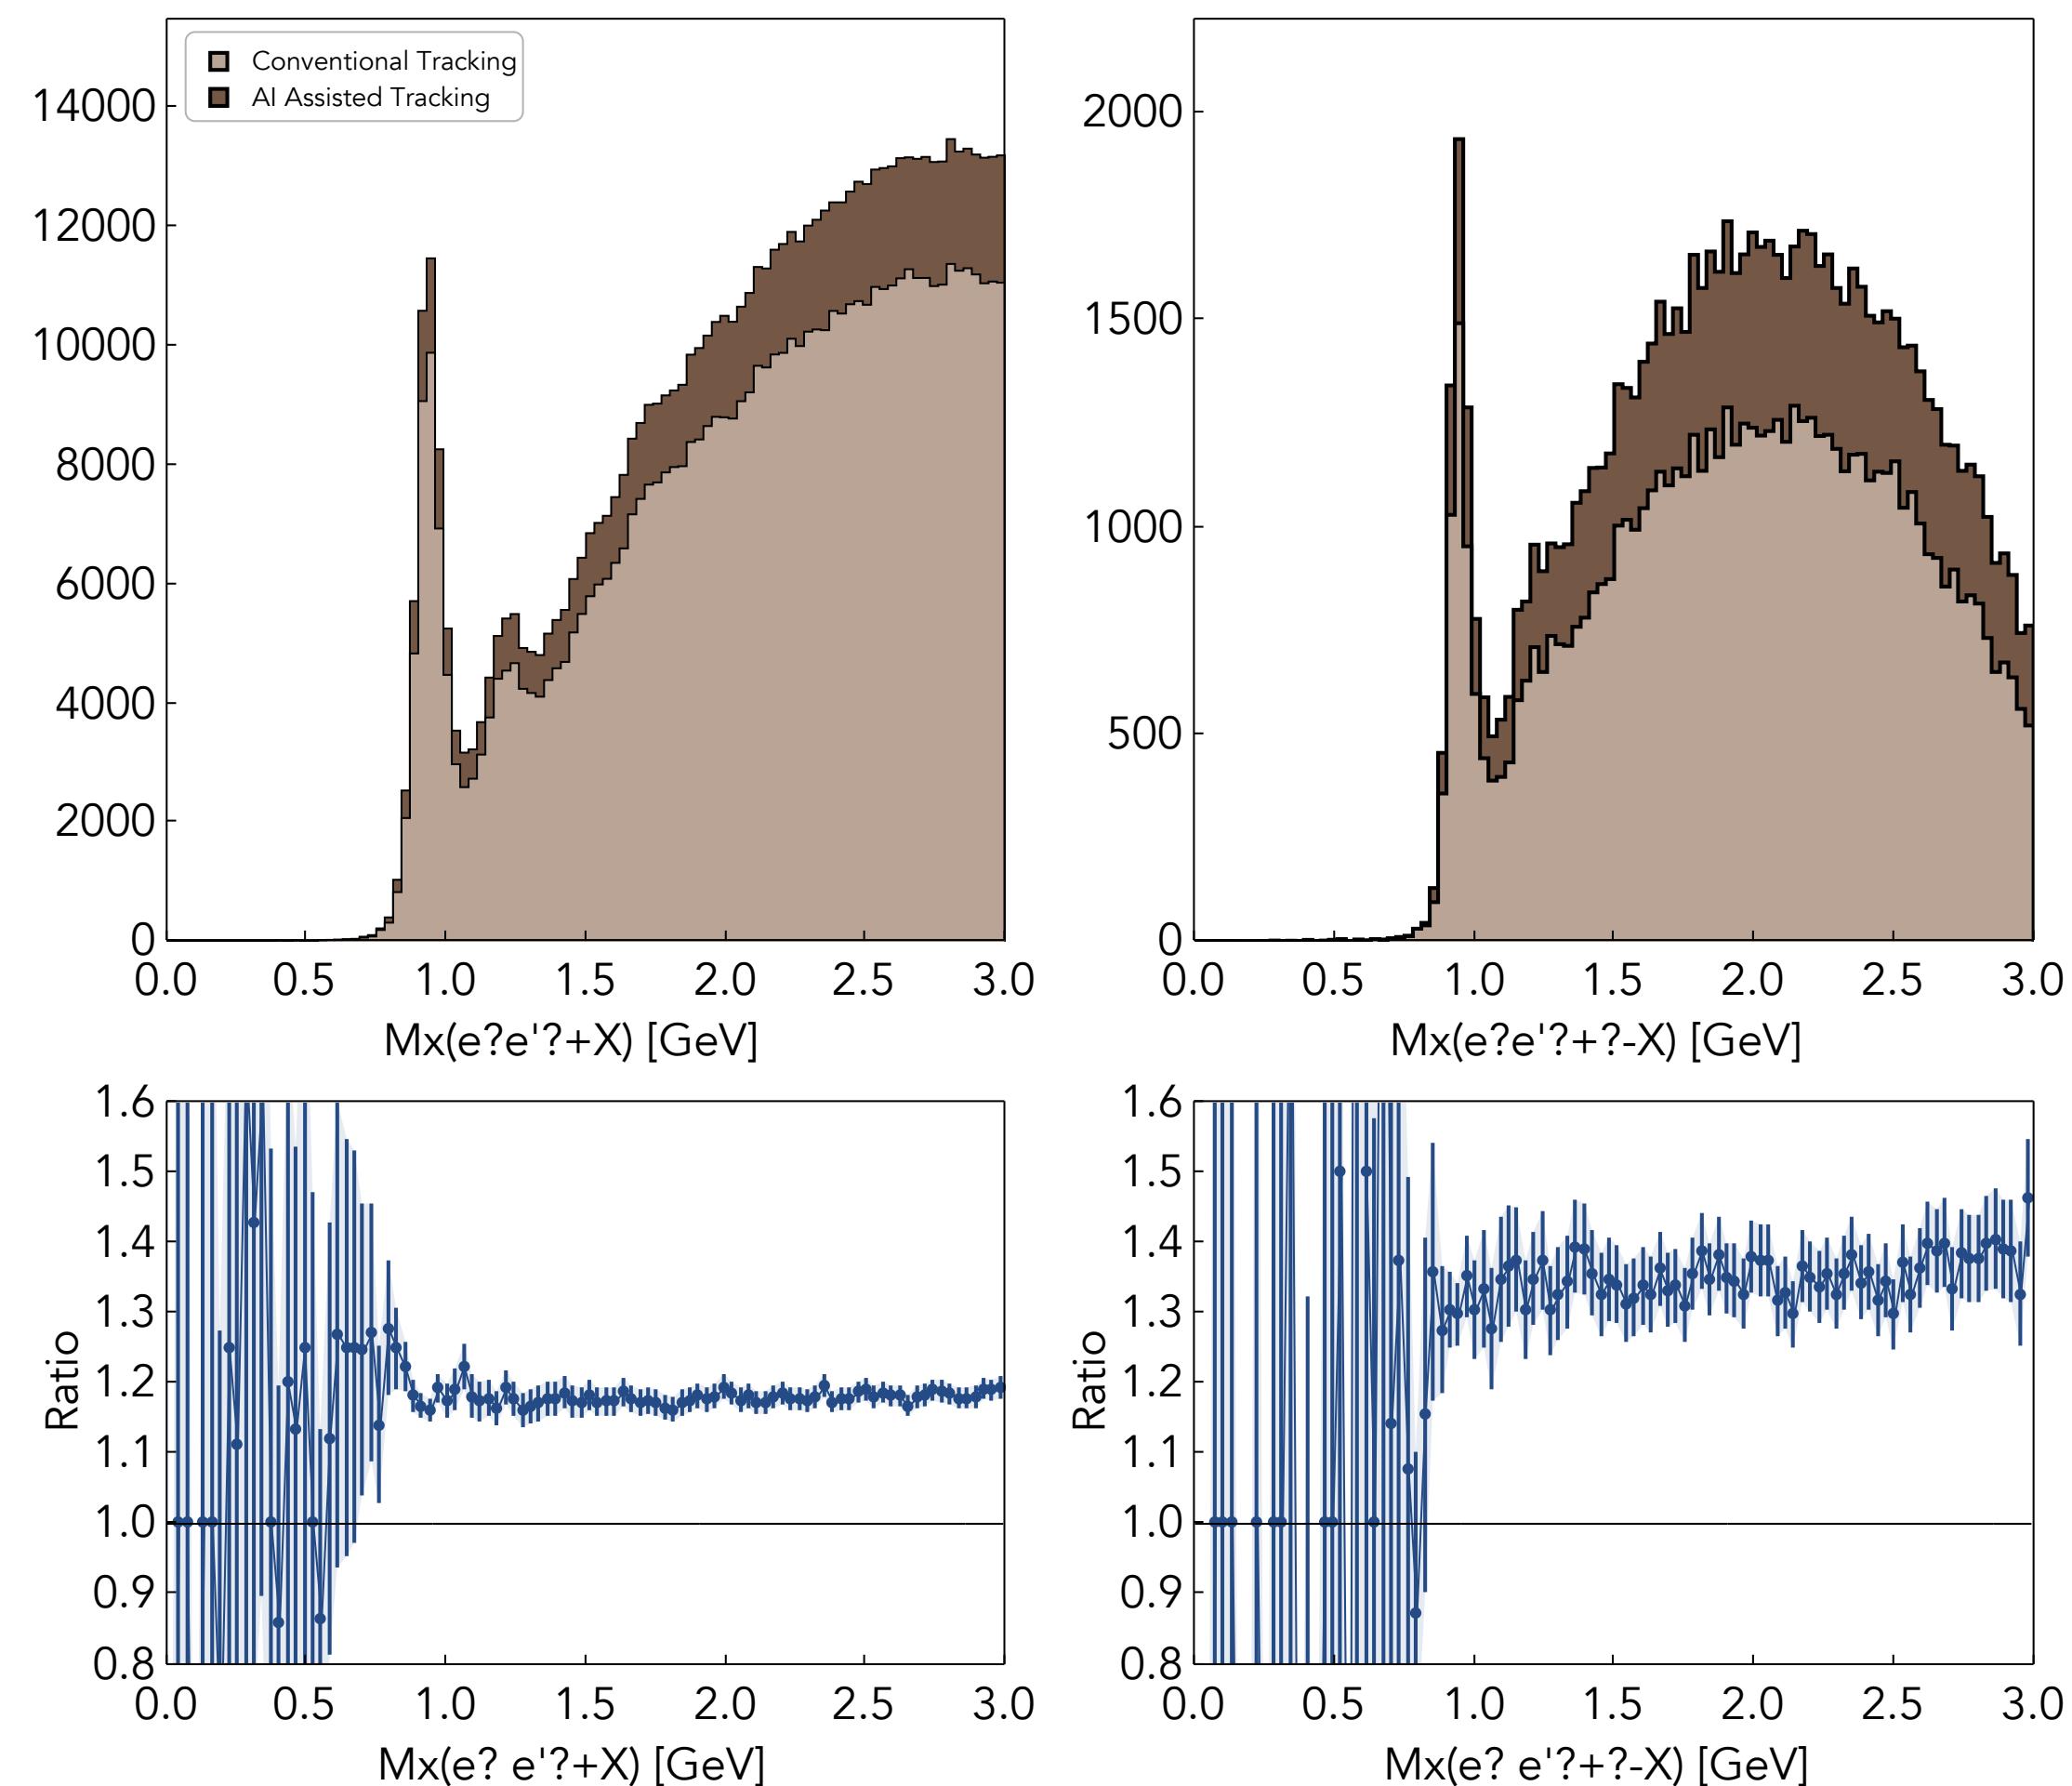

- Use the network we developed for other detectors mTPC (Bonus), Micro-Megas (other?)
- Use for other Experiments GlueX, Solid, EIC ?
